

Eulerity iOS Internship Take-Home Exercise

Today-Only Todo App

Overview

Thank you for taking the time to complete this take-home exercise as part of our iOS intern interview process.

The goal of this exercise is to understand how you approach:

- iOS architecture and fundamentals
 - Product constraints and tradeoffs
 - Code clarity and organization
 - Handling of time, state, and persistence
-

The App

Build a small iOS todo/reminder app with one central constraint:

The app only cares about today.

- Tasks belong to the current day
- Tasks expire at the end of the day
- Each new day starts with a clean slate
- There are intentionally **no future dates, backlogs, or overdue tasks**

This constraint is intentional and should guide your product and technical decisions.

Technical Requirements

- The app should be built using **Swift** and **SwiftUI**.
 - The project's **minimum deployment target must be iOS 16**.
 - Additionally, the app should be fully **offline, with no network requests**.
-

Must-Have Features

1. Today-Only Tasks

- Users can add tasks for the current day
- Tasks from previous days are not shown
- Expiration happens automatically (no manual cleanup required)

2. Task Interaction

- Add a task
- Mark a task as complete
- Persist tasks locally (e.g., SwiftData, CoreData, file storage, etc.)

3. Automatic Day Reset

- When a new day begins, old tasks should no longer appear in the main list
-

Optional Enhancements (Not Required)

You may choose to implement any of the following, but none are required:

UX / UI

- Option to set a task expiration **time** (same day only)
- Option to see previously expired todos
- Completed Task animations
- Haptic feedback
- Thoughtful empty states
- Light/Dark mode support

iOS Platform Features

- Local notifications (must occur before end of day)
- Widgets
- App Intents / Siri

Engineering / Architecture

- Clear separation of concerns

- View models or similar patterns
- Unit tests for business logic
- Date / time abstractions

We do **not** expect all of these. A small, clean implementation is perfectly acceptable.

Out of Scope

To keep the exercise focused and fair, please **do not implement**:

- User accounts or authentication
 - Scheduling tasks for future days
 - Complex settings screens
-

Submission Instructions

Please submit the following:

- A Git repository link - make sure your repository is public
- A **README** that includes:
 - Your overall approach
 - Key decisions or tradeoffs
 - What would you improve with more time
 - Anything you got stuck on and how you worked through it
- A short demo video (30–60 seconds)
- **A record of your AI tool usage - see "Use of AI Tools" below**

You should be prepared to explain and discuss all technical decisions made in your submission.

Use of AI Tools

We are requiring you to use AI-assisted tools (ChatGPT, Claude, Copilot, Cursor, Gemini, etc.) on this exercise. Knowing how to work effectively with these tools is a real skill, and we want to see how you use them.

What we are looking for:

- How you prompt and iterate
- When you accept AI suggestions vs. when you push back or rewrite
- Whether you understand the code you submit
- How you debug things the AI got wrong

Required: Share your AI conversation history

This is a required part of your submission. Please include a record of your AI interactions in one or more of the following formats — whichever works for the tools you used:

- Shareable links to ChatGPT, Claude, or Gemini conversations
- Exported transcripts (most chat tools support copy/paste or export to text/markdown)
- Screenshots of your AI conversations — this is completely acceptable if links or exports are not practical

Light redaction is fine if you have unrelated personal content in a thread — just keep the substantive parts about this project intact. We are not auditing you. We genuinely want to see your process.

To be clear:

- Using AI heavily will not hurt your submission
- Submitting code you do not understand will hurt your submission, regardless of where it came from
- Not providing any AI transcript record is treated as an incomplete submission

.

Questions

If anything in this document is unclear or you need clarification while working on the exercise, please reach out. We're happy to help and want the expectations to be clear.

Thank you again for your time and effort!
